DETAILED ACTION

Claim Rejections - 35 USC § 112

The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Claims 3-7 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention. There is no proper antecedent basis for citation of "the upper electrode" in either claim 3 or 4. Note that as these claims are indefinite, a consideration of their relationship to the prior art cannot be adequately made at this time, when they are made definite such consideration may be made.

Claim 5 presents confusing language: "input ports that can be connected with outward" is the indefinite language here. Claim 6 notes that the "signals from the antenna can be controlled by the micro-electro-mechanical switches" which is not understood. Claim 7 uses similar language regarding the ability of a switch to control a signal. Claim 7 also notes use of "the transmitting terminal" which has no proper antecedent basis.

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(a) the invention was known or used by others in this country, or patented or described in a printed publication in this or a foreign country, before the invention thereof by the applicant for a patent.

Art Unit: 2834

Claims 1 and 2 are rejected under 35 U.S.C. 102(a) as being anticipated by Xu (WO 02/19459). Xu shows (fig. 3) a filter controlled by micro-electro-mechanical switches, it comprises: a substrate (page 2, line 1); a wave-filtering device (300) disposed on the substrate; an input port (306) disposed on one side of the wave-filtering device (300); an output port (312) disposed on another side of the wave-filtering device (300); and micro-electromechanical switches (304, 308) disposed on the wave-filtering device. Note that Xu shows the claimed structural features of the invention; it has been held that a recitation with respect to the manner in which a claimed apparatus is intended to be employed does not differentiate the claimed apparatus from a prior art apparatus satisfying the claimed structural limitations. Ex parte Masham, 2 USPQ2d 1647 (1987).

The electro-mechanical switches (304, 308) can be drive[d] by any actuating methods, such as: electrostatic driving, thermal-electrical driving, piezoelectric driving, etc.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 1, 2 and 5-11, as some of these claims are best understood, are rejected under 35 U.S.C. 103(a) as being unpatentable over Xu (WO 02/19459) in view of Nguyen (US 6,424,074). Given the invention of Xu as noted above, he does not show

Art Unit: 2834

an antenna or an output/input port connected with the antenna wherein the signals from the antenna can be controlled by the micro-electro-mechanical switches to enter the receiving input ports or wherein the signals from the input ports can be controlled by the micro-electro-mechanical switches to enter the transmitting terminal, and then the signals are transmitted by the antenna.

Nguyen shows (fig. 6) a filter controlled by micro-electro-mechanical switches, it comprises: a substrate (col. 8, lines 65 and 66); a wave-filtering device disposed on the substrate; an input port (20) disposed on one side of the wave-filtering device; an output port (24) disposed on another side of the wave-filtering device. Nguyen further shows micro-electromechanical switches (associated with his micromechanical RF channel selector) disposed on the wave-filtering device.

The electro-mechanical switches can be drive[d] by any actuating methods, such as: electrostatic driving, thermal-electrical driving, piezoelectric driving, etc.

Nguyen shows an antenna; an output/input port connected with the antenna wherein the signals from the antenna can be controlled by the micro-electro-mechanical switches to enter the receiving input ports or wherein the signals from the input ports can be controlled by the micro-electro-mechanical switches to enter the transmitting terminal (note that the micromechanical filter is a transmitting/receiving device), and then the signals are transmitted by the antenna.

As noted, Nguyen's filter device comprises: output/input ports (each connected to a specific filter); micro-electro-mechanical switches (also each connected to a specific

Art Unit: 2834

filter and located between each filter and the antenna); and output ports (24), note that each specific filter has an output port.

The signals are inputted form the output/input ports, then, under the control of the micro-electro-mechanical switches, the signals are wave-filtered and outputted. Note that as Nguyen shows the claimed structure, he is regarded as inherently meeting the Applicant's claimed goal of the invention: that of achieving wave-filtering multiplexing.

The wave-filtering devices controlled respectively by the micro-electromechanical switches can be various channels with same frequency.

Allowable Subject Matter

Claims 12-14 are allowed.

The following is an examiner's statement of reasons for allowance: The prior art fails to show or fairly suggest an upper and lower substrate with micro-electromechanical switches and driving circuits formed on the upper substrate and wave-filtering units and connecting circuits formed on the lower substrate with the substrates connected together.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Direct inquiry concerning this action to Examiner Dougherty at (703) 308-1628.
